www.jointstrikegyro.com new military domain name TBA

Larry Neal's new fly-drive vehicle is capable of flying as slow as 20 mph, cruises at 50 mph using half throttle, and tops out at 65 mph--which is perfectly fine for patrolling friendly held MSR's and border security fence lines with friendly troops on the ground below. It has been designed to land in about 20 feet and when folded will fit in a standard garage. It just needs a 100-130 hp diesel to operate using low-volatility JP-8 fuels for military use. He will even have a recovery parachute to bring the SSC down in event of malfunctions etc.

This is exactly what we propose as you know except for a mountain bike in a more minimalist fashion for military recon uses like patrolling MSR's with BATTLEBOX picket forts below. Notice how the rotors when folded are not a pain-in-the-ass! Larry Neal is a genius!
